This project promotes cross-field talent cultivation on music and healthcare. The results were published on conference papers ' and one journal paper exploring the effects on remoting learning disability children's attention and social interaction skills from taiko drumming. The findings showed that the child's degree of inattention had turned from severe to mild, and his social skill disabilities had a significant reduction as well. In general, the six-month taiko group lessons could effectively improve the attention and social interaction skills of students with learning disabilities, and it is hoped that the findings of this research would provide a wealth of new information and reference for subsequent research related to the educational counseling of students with learning disabilities. We also established the credit course "Music, Technology and Health" and earned the award of Ministry of Education. We had applied the Taiwan Association of Music and Health Promotion these days.
